Vacuum Ejector

ZH Series

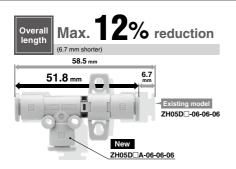

Body Ported Type/Box Type (Built-in Silencer)

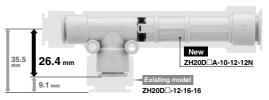

Compact and lightweight

Port size: G threads have been added

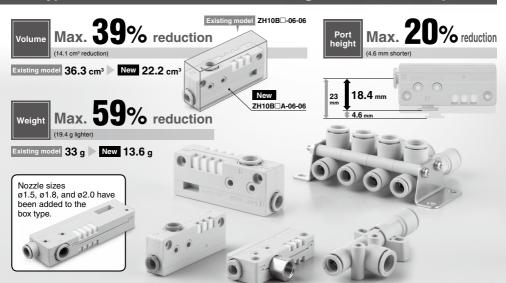

Box type (Built-in silencer)

4 mounting types

| Body type | Direct mounting | Standard bracket mounting | L-bracket mounting | DIN rail mounting |
|---------------------------------|--|---------------------------|--------------------|-------------------|
| Body ported type | 030 | | | |
| Box type (Built-in silencer) | ZH05 to 13 ZH15 to 20 For ZH15, 18, and 20, mount using 2 of the 3 mounting holes. | — (Not available) | 000007 | 2000 /4 |

of product type

Easy identification A silencer and standard bracket are available.

* Shipped together with the product

Silencer

Silencer can only be selected for EXH port with Onetouch fitting

The silencer part number depends on the size of the EXH port.

| EXH port | Silencer part no. |
|----------|-------------------|
| 06 | AN10-C06 |
| 07 | AN10-C07 |
| 08 | AN15-C08 |
| 09 | AN15-C08 |
| 10 | AN20-C10 |
| 11 | AN20-C11 |
| 12 | AN30-C12 |

No silencer available for ZH18/ 20D□A in inch size for EXH port size '13'

In that case, select the screw-in connection, and order silencer AN30-N03 and AN40-N04 separately

For details about silencers, refer to the AN series in the Web Catalog.

- *1 Select only One-touch fitting if ZH ejectors are to be clamped. The screw-in connectors cannot be used as they will interfere with each other when clamped together. Refer to pages 758 and 759 to find the models for which clamp mounting is not available.
- *2 The material of the nut and bolt is carbon steel with a trivalent chromate surface treatment.
- *3 The same screw set is used for 1 station of ZH13 \Bullet A/15 \Bullet A and ZH18/20 \Bullet A.

How to Read Flow Rate Characteristics Graph

Flow rate characteristics are expressed in ejector vacuum pressure and suction flow. If suction flow changes, the vacuum pressure will also be changed. Normally this relationship is expressed in ejector standard operating pressure use. In the graph, Pmax is maximum vacuum pressure and Qmax is maximum suction flow. The values are specified according to catalog use. Changes in vacuum pressure are expressed in the below order

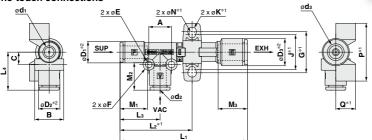

- 1 When the ejector suction port is covered and made airtight, the suction flow becomes zero and vacuum pressure is at the maximum value (Pmax).
- 2. When the suction port is opened gradually, air can flow through, (air leakage), suction flow increases, but vacuum pressure decreases, (condition P1 and Q1)
- 3. When the suction port is opened further and fully opened, suction flow moves to the maximum value (Qmax), but vacuum pressure is near zero (atmospheric pressure).

As described above, the vacuum pressure changes when the suction flow changes. In other words, when there is no leakage from the vacuum port, the vacuum pressure can reach its maximum, but as the amount of leakage increases, the vacuum pressure decreases. When the amount of leakage and the maximum suction flow become equal, the vacuum pressure becomes almost zero.

In the case when a ventilative or leaky workpiece should be adsorbed, take note that vacuum pressure will not rise.

ZH Series Circuit Examples

⚠ Caution

Handling of Circuits

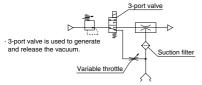

Select the related air preparation equipment with appropriate size in reference to the circuit example below.

Ex. 1 Supply valve (2-port valve) + Suction filter

2-port valve is used to generate and stop the vacuum. Vacuum is released to the atmosphere. A suction filter is installed to protect the elector.

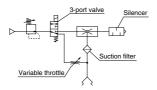

Ex. 2 Supply valve (3-port valve) + Variable throttle + Suction filter

3-port valve is used to generate and stop the vacuum (vacuum release is performed simultaneously). Variable throttle is installed for break flow adjustment. A suction filter is protecting the ejector.

 It is not possible to bring this circuit to a complete stop.
 A valve must be added on the release side circuit in order to perform a complete stop.

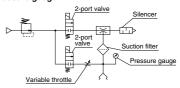

Ex. 3 Supply valve (3-port valve) + Variable throttle + Suction filter + Silencer

Power failure is prevented by changing the valve piping of Ex. 2 and applying vacuum generation N.O. specification. Variable throttle and suction filters are installed. A silencer is mounted to the exhaust port (to reduce exhaust noise).

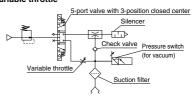

It is not possible to bring this circuit to a complete stop.
 A valve must be added on the release side circuit in order to perform a complete stop.

Ex. 4 Supply valve (2-port valve) + Release valve (2-port valve) + Variable throttle + Silencer + Suction filter + Pressure gauge

Vacuum generation and vacuum release are controlled by a supply valve and release valve. A pressure gauge is installed to visually check the vacuum pressure during adsorption. The suction filter should be mounted to the location where the collected dust should not flow back due to the release of air. (When using the 3-port valve, seal the R-port of the release valve.)

Ex. 5 Supply/Release valve (5-port valve with 3-position) + Variable throttle

5-port valve with 3-position closed center is used to control the vacuum generation and release. A check valve is installed to the vacuum port to prevent vacuum pressure from being reduced when the supply valve is OFF*1. A pressure switch is installed in the vacuum circuit to detect pressure. A suction filter should be mounted to the position where the duct collected by release air can be flushed by released air.

*1 The vacuum may leak depending on the check valve used. If a breathable workpiece is used, vacuum pressure is reduced rapidly. Sufficient verification is required before use.

ZH Series Specific Product Precautions 1

Be sure to read this before handling the products.

For safety instructions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

Mounting

⚠ Caution

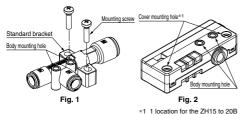

1. Load to the ejector body

As the body material is resin, do not apply any load to the port after mounting. Prevent operations which generate moment, as they may cause performance reduction or damage to the body.

2. Standard bracket

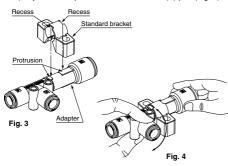

It is possible to mount and remove the standard bracket, which is included with this product (an option without a bracket can also be selected). Do not excessively pull on or bend the bracket as it may break. The appropriate tightening torques for the standard bracket, body mounting hole (Fig. 1), and cover mounting hole (Fig. 2) are shown below.

For M3: 0.315 ±0.03 N·m For M4: 0.76 ±0.08 N·m

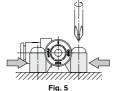

● Mounting of the standard bracket (ZH05 to 15D□A) and

- adjustment of the vacuum (V) port
 Align the recess of the standard bracket and the protrusion of the adapter. Push the bracket from the top onto the adapter (Fig. 3).
- 2) Adjust the adapter to rotate the vacuum (V) port (Fig. 4).

 When mounting the product with the standard bracket, tighten the screw while holding both sides of the bracket.
 If the fit of the bracket is

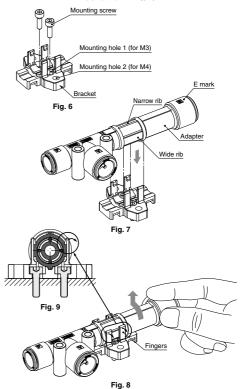

loose, the ejector may move after tightening the screws. (Fig. 5)

Mounting of the standard bracket (ZH18/20D□A) and adjustment of the vacuum (V) port

- 1) The standard bracket for the ZH18/20D□A can be mounted by using either mounting hole 1 or 2 (Fig. 6).
- When mounting the product through mounting hole 1, mount the bracket to the installation surface first (Fig. 6).
- 3) To mount the product to the bracket, push it down with the adapter's narrow rib and E mark facing upward and the wider rib to the side (Fig. 7). Hold the adapter when rotating the vacuum (V) port for adjustment.
- 4) To remove the body from the bracket, unclip the fingers (2 pcs.) on one side and pull the ejector upward while rotating the adapter. If the ejector is pulled upward without first unclipping the fingers, it may damage the bracket (Fig. 8, 9). If an increased holding force is required, please contact your SMC sales representative.

Bracket for ZH18/20D□A

ZH Series Specific Product Precautions 2

Be sure to read this before handling the products.

For safety instructions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

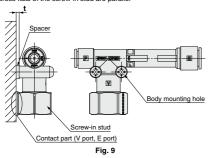

Mounting

3. Precautions for mounting with the body mounting holes

If the models listed below are to be mounted on a plane surface through the body mounting holes, the outside diameter of the screw-in stud will interfere with the mounting surface. Therefore, use a spacer with a thickness of "t"dimension or more (Fig. 9).

| Applicable model | t *1 |
|------------------------------------|-------------|
| ZH15D□A-□-N03-□ ZH15B□A-□-N03 | 2 |
| ZH18D□A-□-N03-□ | |
| ZH18B□A-□-N03 ZH20D□A-□-04-□ | |
| ZH20D□A-□-F04-□ ZH20D□A-□-N04-□ | 1 |
| ZH20B□A-□-04 | |
| ZH20B□A-□-F04 ZH20B□A-□-N04 | |

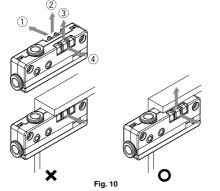

*1 When the body mounting hole surface and the width across flats of the screw-in stud are parallel

4. Exhaust port

When mounting the box type product, be sure to allow release from at least 2 of the 4 exhaust directions shown in Fig. 10. If 3 or more directions are covered, the vacuum performance of the ejector will be reduced due to exhaust air back pressure.

Precautions for mounting the box type

Piping

1. Piping diameter

The piping diameter for each port should be the standard size for One-touch fittings. If the piping diameter is reduced, it may lead to the insufficient flow of supply air, the reduction of suction flow, and a reduction in the vacuum pressure.

2. Exhaust port piping

It there is any piping or a silencer connected to the exhaust port, keep the back pressure at 5 kPa or less. Increased back pressure may lead to the reduction of suction flow and delays in the transport cycle time. If a silencer is connected, the specified vacuum performance is reduced by 10% or less.

3. One-touch fittings

Refer to the "Fittings and Tubing Precautions" on the SMC website for handling One-touch fittings.

4. Piping to the female thread type

When mounting a fitting to the screw-in stud (female thread), hold the width across flats with an appropriate size wrench. If the load is applied to the resin body directly, it may damage the body.

Model Selection

1. Supply valve

Select a supply valve which can supply a sufficient flow rate that takes the ejector air consumption into account. If the flow rate of the supply valve is insufficient, it may lead to vacuum failure. The selected supply valve should have a C factor of at least the value shown in the table below.

Minimum Supply Valve C Factor

| Model | C [dm ³ /(s-bar)] |
|---------|------------------------------|
| ZH05□□A | 0.12 |

2. Mounting of air equipment

If particles are sucked through the vacuum (V) port during workpiece adsorption, the vacuum performance might be reduced due to the adhesion of particles in the air passage of the product or clogging of the exhaust passage (silencer). The installation of an air suction filter (ZFA, ZFB, or ZFC series) in the middle of the piping on the vacuum side is recommended to prevent performance reduction. If air containing moisture is sucked, vacuum performance might also be reduced for the same reason. In this case, install a drain separator for vacuum (AML) series).

ZH Series Specific Product Precautions 3

Be sure to read this before handling the products.

For safety instructions, refer to the "Handling Precautions for SMC Products" and the "Operation Manual" on the SMC website: https://www.smcworld.com

Air Supply

1. Quality of supply air

The recommendation for cleanliness of the compressed air supplied to the product is as specified in "System No. C [Dry air]" of the "Model Selection Guide of Air Preparation Equipment" on the SMC website. This describes the impurity content in the compressed air based on the grade of compressed air quality 2:4:3, 2:5:3 and 2:6:3 of ISO 8573-1:2010 (JIS B 8392-1:2012)

If impurities enter the product, vacuum performance might be reduced due to the deterioration of the air passage or clogging of the exhaust system.

Ejector Characteristics

1. Intermittent noise during vacuum generation

When the ejector standard supply pressure is close to the pressure that generates peak vacuum pressure, the vacuum pressure may become unstable due to fluid vibration. If there is any operation failure or the intermittent noise needs to be reduced, increase or decrease the supply pressure. Avoid the supply pressure range where the vacuum pressure becomes unstable.

2. Temperature reduction and vapor condensation during vacuum generation

When the ejector generates vacuum, compressed air expands adiabatically after passing through the nozzle. This reduces the temperature around the nozzle, so condensation might be generated on the product surface (the condensation dew point may vary depending on the temperature and relative humidity of the operating environment).

When Operating the Ejector

1. Exhaust air

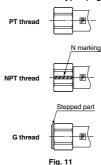

If solid substances are sucked in through the vacuum (V) port, they will be discharged from the exhaust port at a high speed if the exhaust (EXH) port is opened. Therefore, do not look into the exhaust port or direct the exhaust port toward a person when the ejector is operating.

2. Exhaust noise

Models with a large nozzle diameter generate a large exhaust noise if the exhaust (EXH) port is opened. Install piping or a silencer to the exhaust port to reduce the exhaust noise.

Identification

1. The appearance of the screw-in connection differs depending on the thread type. (Fig. 11)

For the box type, a different identification mark symbol is used according to the vacuum pressure reached (type S or type L). (Fig. 12)
